

Senao AP Handy Hint #1

Posted by: RobClark on Apr 27, 2004 - 08:25 PM

I have been bitten by this twice:

When changing config on a [Senao](#) AP, it seems quite common that it does not come back to life as you would hope. The usual trick is power cycle, and/or a 5+ sec on the Reset button (ie load Factory defaults).

But... it seems a short (2~3 sec) power cycle is not a real hard reboot. You need to power off for a 'few' minutes (2~5??) to get th to boot up cleanly.

I guess there is some capacitor that does not discharge fully in 2~3 sec.
